ABSTRACT

It is to provide a pair of hairdressing scissors with finger grips that can accommodate the user even if his or her finger size, and his or her preference in structure and make of the finger grip, are different. In order to do so, each shear body of the haircutting scissors is at least composed of a shank and a finger grip, where the finger grip is removably attached to the shank. Further, different finger grips are prepared to be exchanged with one another.
